

Resume Ranking System

- Python project to rank candidate resumes against a job description.
- Extracts text from PDFs using pdfplumber.
- Falls back to OCR with pytesseract + Poppler when needed.
- Outputs ranked results to CSV.

Project Structure

- data/
- output/ (empty, output file saved here)
- poppler/Library/bin/ (Poppler binaries)
- src/rank_resume.py
- README.md, requirements.txt

Dependencies

- pandas
- scikit-learn
- pdfplumber
- pdf2image
- pytesseract
- python-pptx
- Tesseract OCR and Poppler installed separately

Poppler Setup

- Place Poppler binaries under `poppler/Library/bin`
- Ensure `pdftoppm.exe` and `pdftinfo.exe` exist there
- Script uses relative path from `src/rank_resume.py`
- This makes the repo self-contained for OCR fallback

Usage

- Put job description in data/jd.txt
- Put PDFs in data/resumes/
- Run: `python src/rank_resume.py`
- Output CSV is generated in `output/ranked_candidates.csv`

Current Results

- Ranked resume output saved to `output/ranked_candidates.csv`
- Ensure resume PDFs have extractable text or OCR fallback works
- Review script warnings if any resume returns zero text.
